

# AutoSock Wear Indications

## Stage 1: Hairy surface

The road contact fabric gets hairy and the typical peach skin effect occurs between approx. .5-1 mile which is normal and aids in the friction behavior.

## Stage 2: Minor wear

The road contact fiber shows minor yarn cracks and the first signs of holes. The product is still fully useable.

- Discoloration
- Minor rips/tears as it is a wear product and roads aren't perfect
- Potential smell from road debris

## Stage 3: Advance Wear

Bigger holes and cracks appear. The black bottom material is more visible. The product is still working but it is recommended to buy a new set of AutoSock.
